No Heat? Here's your checklist to restart your system:

- Check your thermostat to make sure it's set high enough to call for heat.
- Make sure you have oil in your tank.
- Locate the emergency shutoff switch, usually located near the basement steps or next to your heating system. Make sure the switch is in the "ON" position.
- Sometimes a simple system reset is all that's needed. Locate your heating system's burner and press the red reset button ONCE (and only ONCE) and listen for the system to start up.
- Check for any blown fuses or tripped circuit breakers in your electrical supply panel. A breaker switch is tripped if it is moved slightly from the ON position.

Remember, if you do need assistance or repair, you can rely on us for service--our technicians are local, licensed and uniformed.
