Worried about a frozen oil line? Have an outside oil tank?

Get a heated pump for your tank!

Have you had an issue with your oil line freezing? This is the result of extreme cold and windy weather. During these conditions home heating oil gels, the viscosity of the oil changes, resulting in a no-flow/no-heat situation. Clearing the frozen oil line and filter to produce heat can be costly and potentially dangerous, and is not covered under your service plan.

A great preventative:

This efficient, low-voltage heater sits on top of your tank. New technology means that this heater actually **heats the oil as it flows through the draw tube, before it gets to your heating system**. This device turns on and off automatically based on the temperature. When oil isn't being pumped it gives you the added protection of also heating the oil inside your tank.

Call us today to schedule your installation of a heated pump, and stop worrying about when your oil lines might freeze!
